Motivation

Reading is central to societal participation, making reading research a broad, interdisciplinary field that spans from basic research to educational applications. This diversity is welcomed but comes at a cost. Most research is conducted in a single language by separate groups, compromising comparability, replicability, and generalisability. Also, best practice knowledge is transmitted only informally within labs, leading to a lack of consensus and heterogeneity across labs.

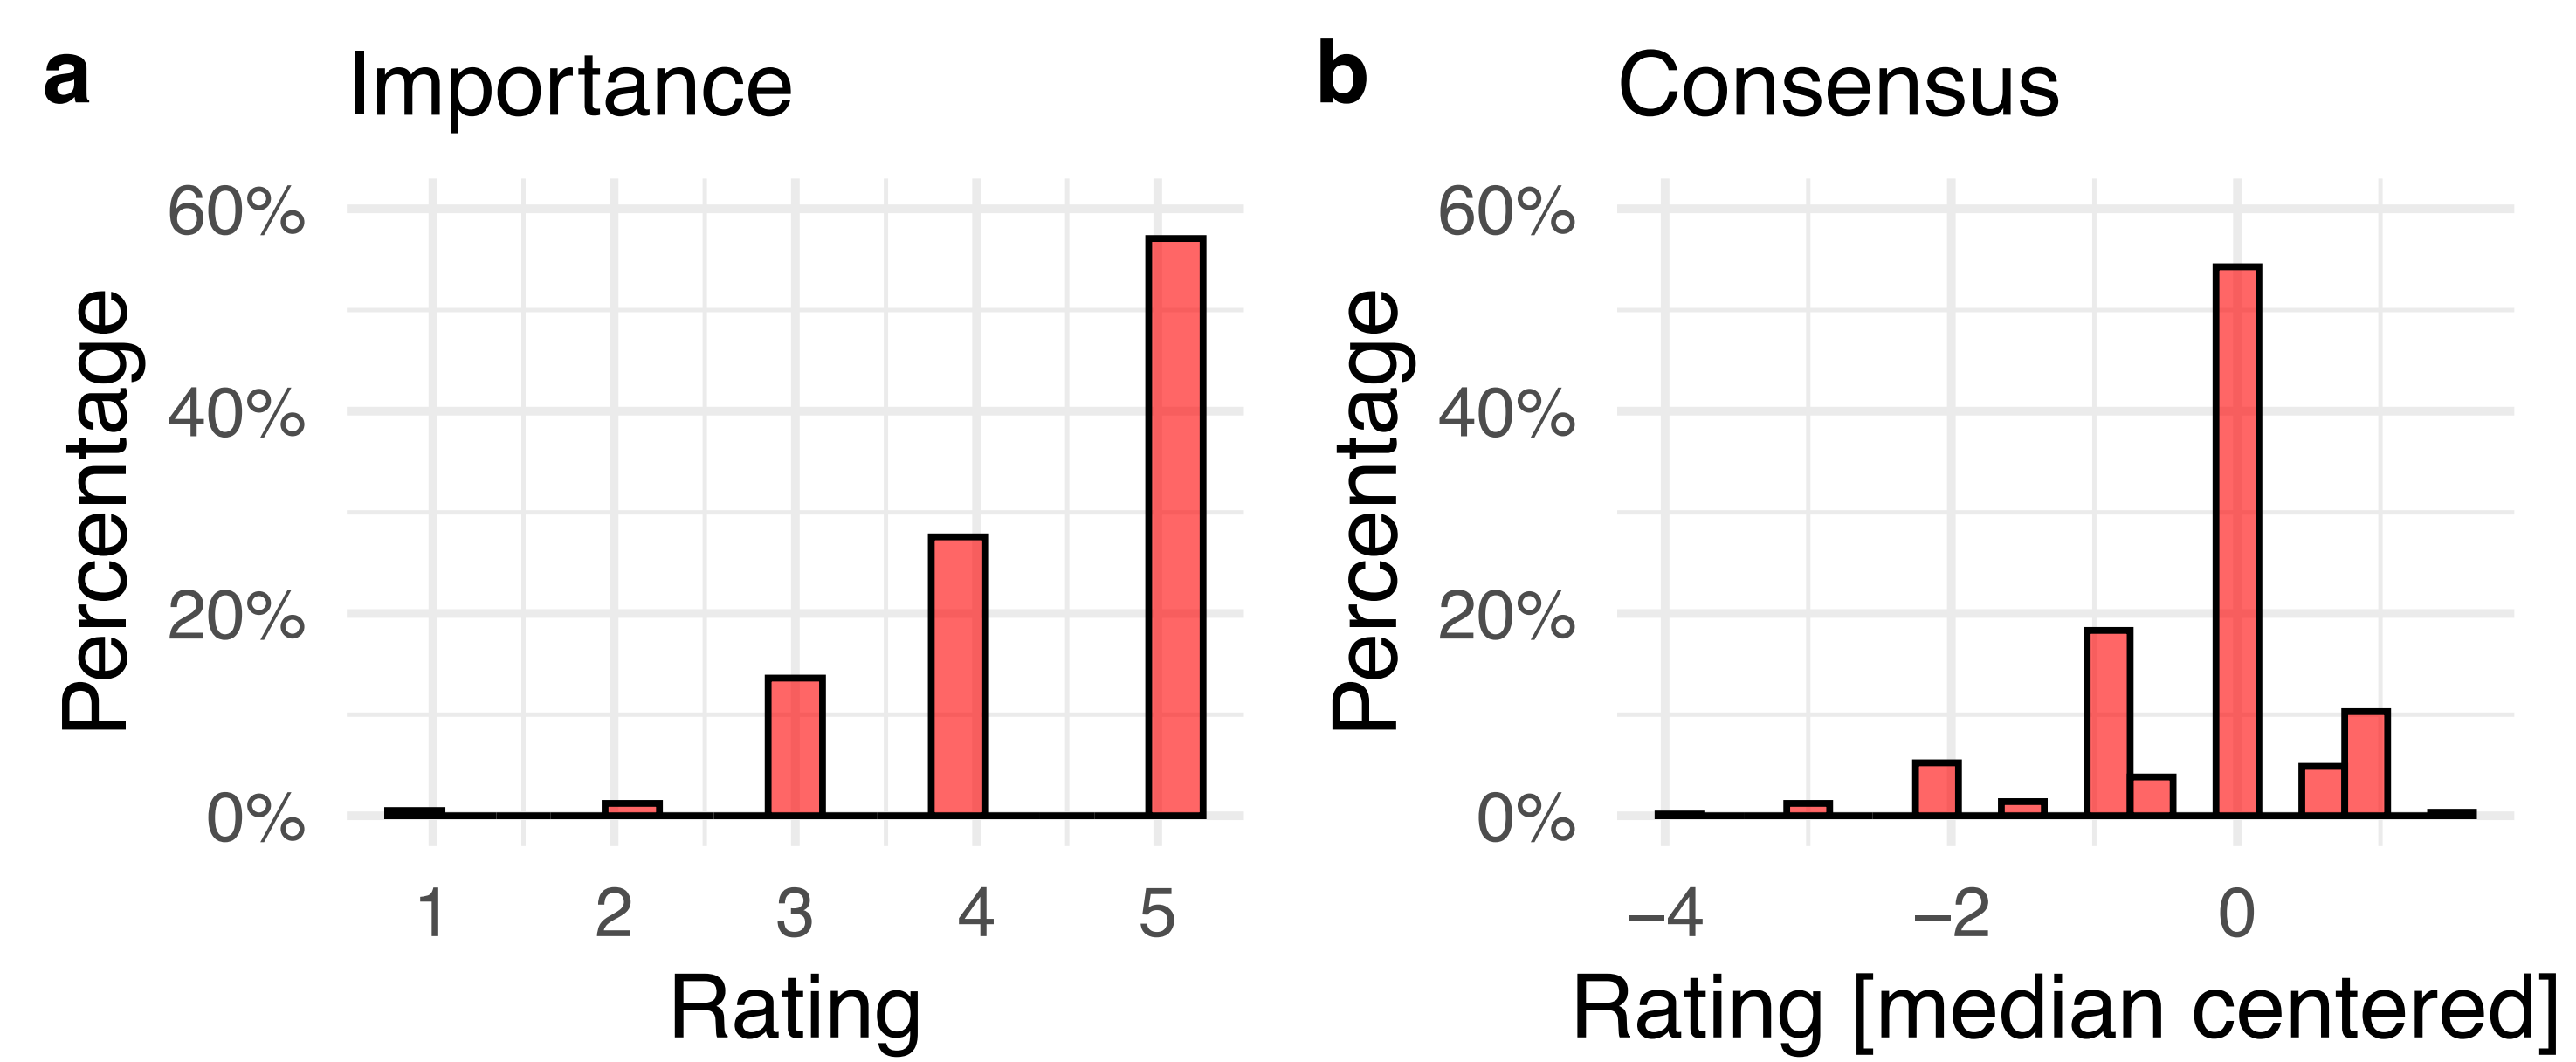

Transparent, sUstainable and Transferable (TRUST) Guidelines

- 1. Consensus-based research protocol for current best practices in psycholinguistic reading research by integrating expert knowledge from a consortium of more than 20 reading researchers from Germany, Austria, Switzerland, and several non-German-speaking countries (Belgium, Italy, UK).
- 2. Guidelines are openly available as a living document on a homepage, with a versioning infrastructure that makes changes transparent and enables discussion, consultation, and adaptation.
- 3. The open nature of the guidelines allows easy extension to other languages, groups (e.g., dyslexics), methods (e.g., brain imaging), and paradigms (e.g., single word or text presentation).
- 4. Provide a document intended to raise research standards in reading research worldwide, as a service to the community, potentially increasing replication rates and generalizability of relevant effects and phenomena.

Importance ratings

Histograms of (a) expert importance ratings and (b) median-centered ratings, showing the distance from the median rating of each item, giving an indication of consensus. 573 ratings; N = 18 raters; Mean of 18 years of experience: SD = 9.1; Min: 6 y.; Max: 40 y.

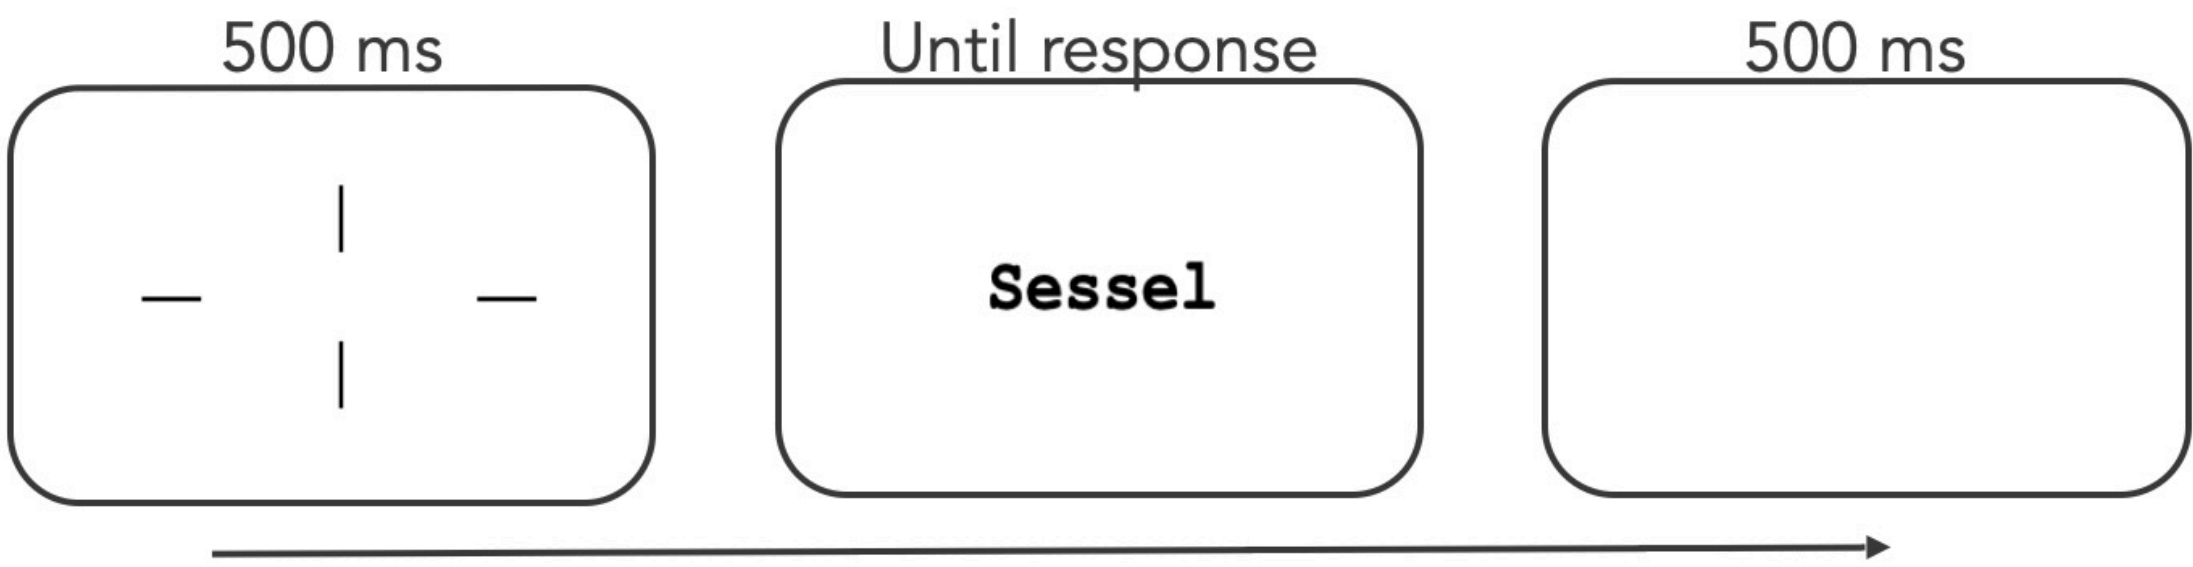

Funding

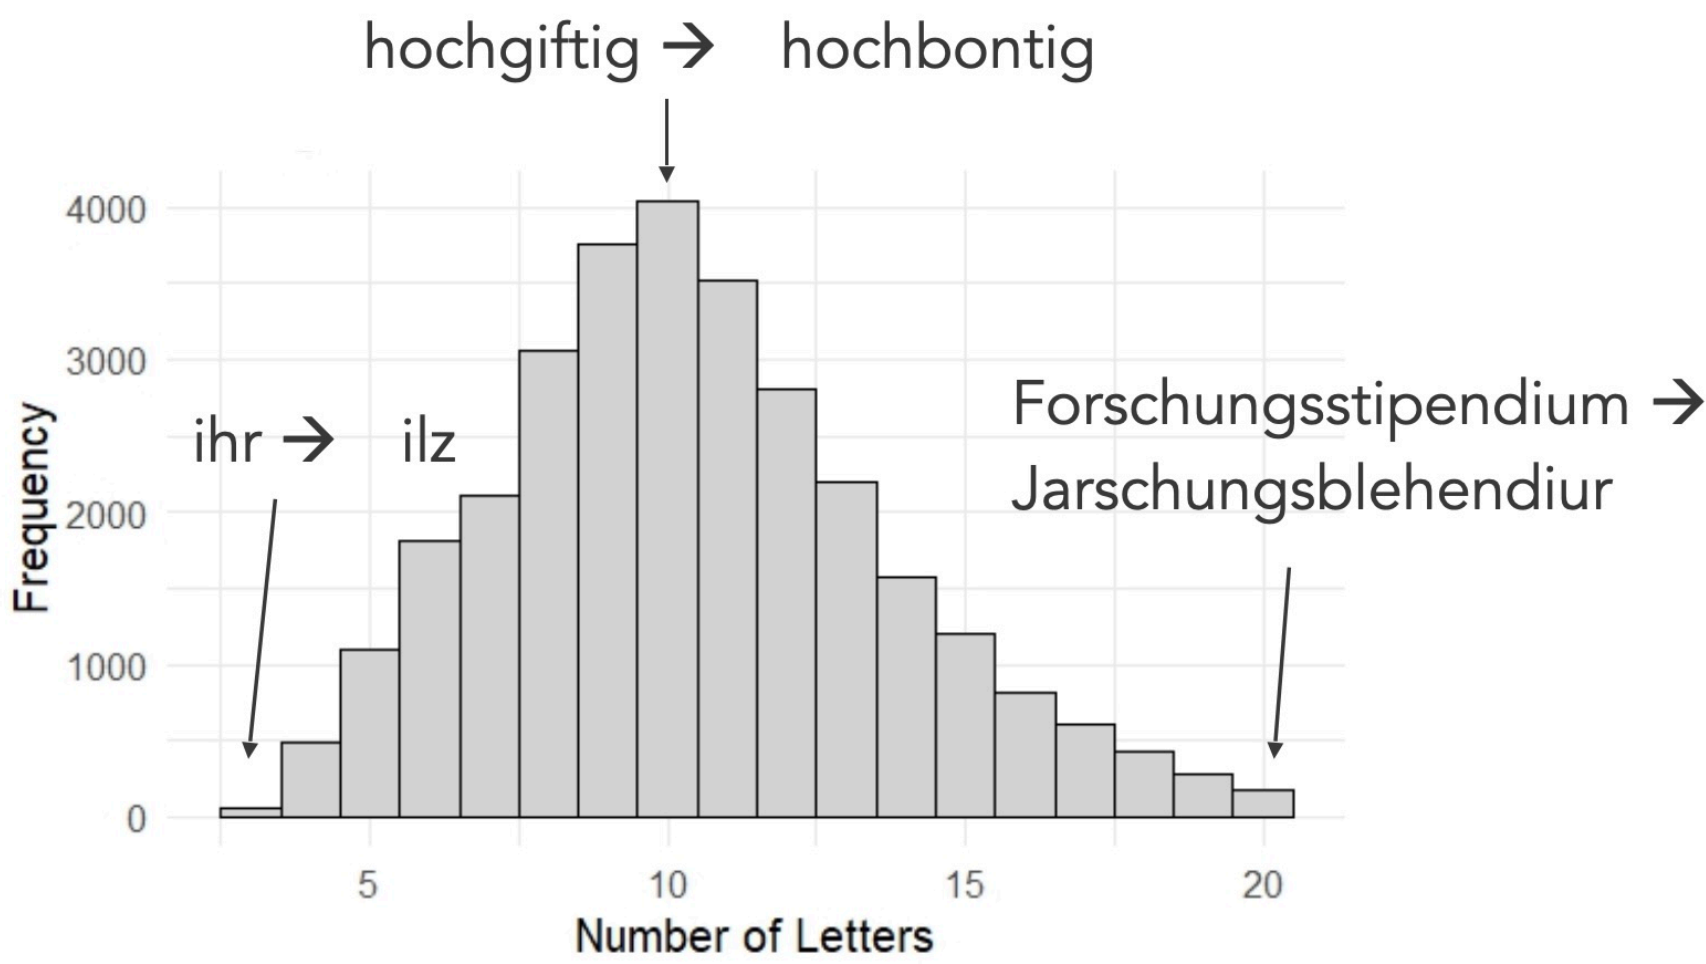

The German Lexicon Project (GLP)

- Psycholinguistic „Megastudy“
- Hypothesis-free behavioral data (Response times, Accuracy) from a Lexical Decision Task
- Openly accessible database as a resource for reading/word recognition research
- German has some interesting linguistic features, e.g., very productive compounding, capitalization rules
- Opportunity to apply guidelines generated from the TRUST network, test their applicability

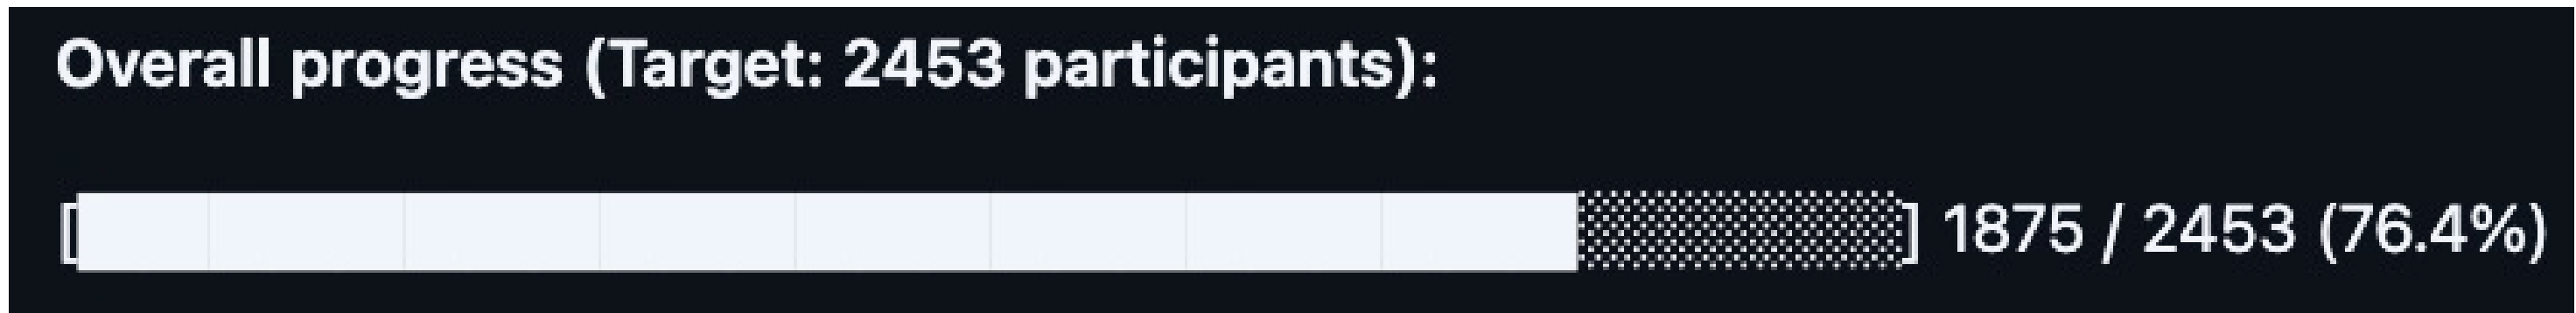

Task

Stimuli 38 000 German Words and Non-Words
Participants Goal: 2 453 native speakers of German
